Describe what your project presents within 150 words

Abstract

The **Clinical Record Linkage and Care Coordination Platform** is a secure digital healthcare system that connects patient records from different hospitals, clinics, laboratories, and pharmacies into a single, unified platform. It enables authorized healthcare professionals to access accurate and up-to-date medical information, including patient history, diagnoses, prescriptions, laboratory reports, allergies, and treatment plans. The platform improves communication and collaboration among doctors, specialists, nurses, and other healthcare providers, ensuring coordinated and continuous patient care. By reducing duplicate medical tests, preventing medication errors, and enabling faster clinical decisions, it enhances healthcare efficiency and patient safety. The system incorporates strong security features such as encryption, role-based access control, and patient consent management to protect sensitive health information and maintain data privacy. It also supports interoperability between different healthcare systems, making information exchange seamless and reliable. Overall, the platform improves the quality of healthcare services, reduces operational costs, enhances patient outcomes, and provides a scalable, efficient, and patient-centered solution for modern healthcare management.
